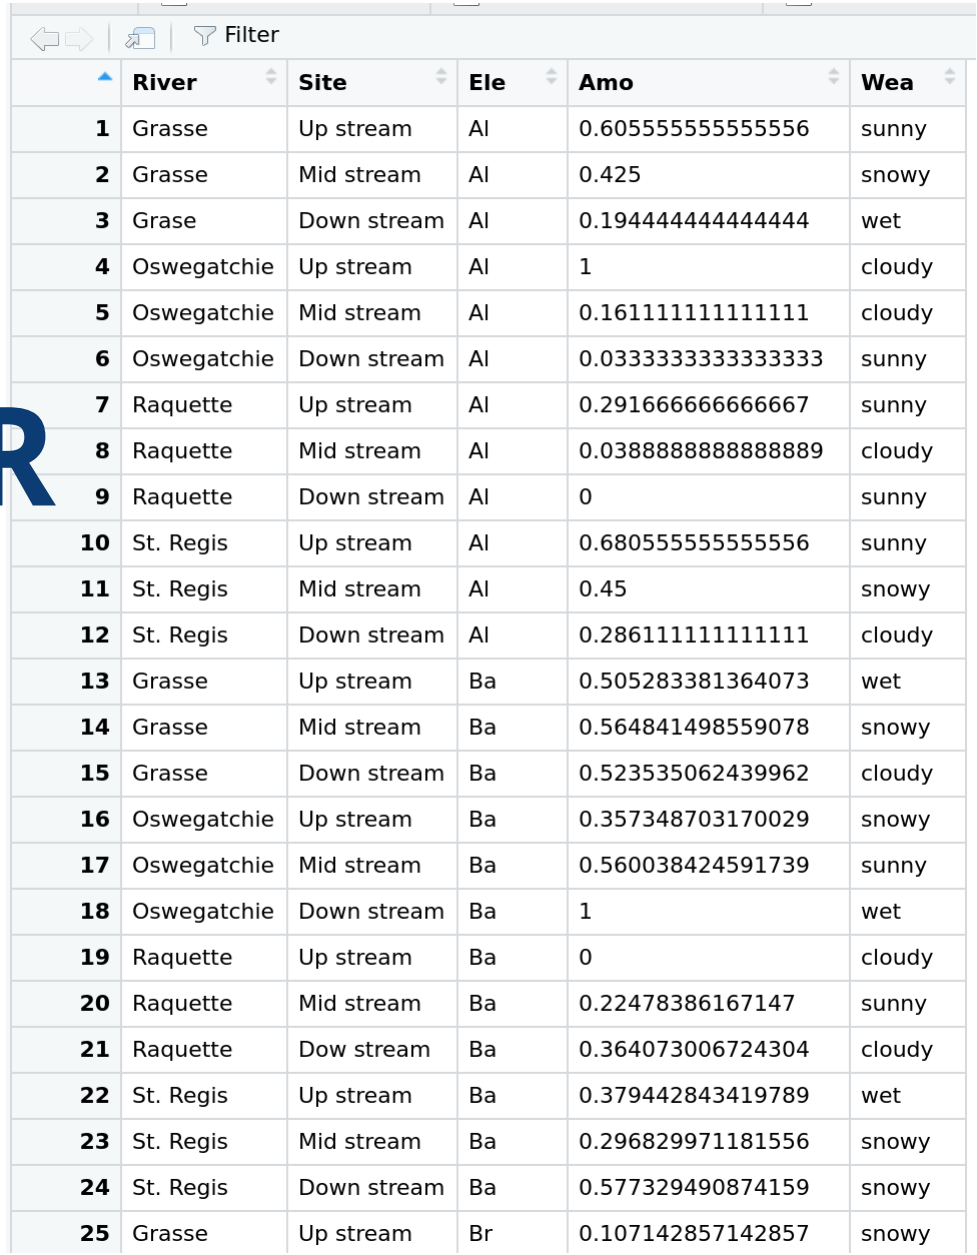
Workshop: Dealing with Data in R

Loading and Cleaning Data in R

I know the file exists, why doesn't R?



Filter

Steffi LaZerte https://steffilazerte.ca | *Compiled: 2022-01-26*

First things first

Save previous script

Open New File

(make sure you're in the RStudio Project)

Add **`library(tidyverse)`** to the top

Save this new script

consider names like **`cleaning.R`** or **`3_loading_and_cleaning.R`**

R base vs. `tidyverse`

R base

- R base is basic R
- Most packages used are installed and loaded by default

R base vs. `tidyverse`

R base

- R base is basic R
- Most packages used are installed and loaded by default

`tidyverse`

- Collection of 'new' packages developed by a team closely affiliated with RStudio
- Packages designed to work well together
- Use a slightly different syntax
- Among others, includes packages used for data transformations and visualizations:
  - e.g., **`ggplot2`**, **`dplyr`**, **`tidyr`**, **`readr`**

R base vs. `tidyverse`

R base

- R base is basic R
- Most packages used are installed and loaded by default

`tidyverse`

- Collection of 'new' packages developed by a team closely affiliated with RStudio
- Packages designed to work well together
- Use a slightly different syntax
- Among others, includes packages used for data transformations and visualizations:
  - e.g., **`ggplot2`**, **`dplyr`**, **`tidyr`**, **`readr`**

> Can be helpful to understand whether functions are **`tidyverse`** or R base functions

Dealing with data

1. Loading data

- Get your data into R

2. Looking for problems

- Typos
- Incorrectly loaded data

3. Fixing problems

- Corrections
- Renaming

4. Setting formats

- Dates
- Numbers
- Factors

5. Saving your data

1. Loading Data

Data types: What kind of data do you have?

Specific program files

Type	Extension	R Package	R function
Excel	.xls, .xlsx	`readxl`	`read_excel()`
Open Document	.ods	`readODS`	`read_ods()`
SPSS	.sav, .zsav, .por	`haven`	`read_spss()`
SAS	.sas7bdat	`haven`	`read_sas()`
Stata	.dta	`haven`	`read_dta()`
Database Files	.dbf	`foreign`	`read.dbf()`

Data types: What kind of data do you have?

Specific program files

Type	Extension	R Package	R function
Excel	.xls, .xlsx	`readxl`	`read_excel()`
Open Document	.ods	`readODS`	`read_ods()`
SPSS	.sav, .zsav, .por	`haven`	`read_spss()`
SAS	.sas7bdat	`haven`	`read_sas()`
Stata	.dta	`haven`	`read_dta()`
Database Files	.dbf	`foreign`	`read.dbf()`

Convenient but...

- Can be unreliable
- Can take longer

For files that don't change, better to save as a `*.csv` (Comma-separated-variables file)

Data types: What kind of data do you have?

General text files

Type	R base	`readr` package (`tidyverse`)
Comma separated	`read.csv()`	`read_csv()`, `read_csv2()`
Tab separated	`read.delim()`	`read_tsv()`
Space separated	`read.table()`	`read_table()`
Fixed-width	`read.fwf()`	`read_fwf()`

Data types: What kind of data do you have?

General text files

Type	R base	`readr` package (`tidyverse`)
Comma separated	`read.csv()`	`read_csv()`, `read_csv2()`
Tab separated	`read.delim()`	`read_tsv()`
Space separated	`read.table()`	`read_table()`
Fixed-width	`read.fwf()`	`read_fwf()`

- **`readr` package** especially useful for big data sets (fast!)
- Error/warnings from `readr` are a bit more helpful

Data types: What kind of data do you have?

General text files

Type	R base	`readr` package (`tidyverse`)
Comma separated	`read.csv()`	`read_csv()`, `read_csv2()`
Tab separated	`read.delim()`	`read_tsv()`
Space separated	`read.table()`	`read_table()`
Fixed-width	`read.fwf()`	`read_fwf()`

- **`readr` package** especially useful for big data sets (fast!)
- Error/warnings from `readr` are a bit more helpful

> We'll focus on:
>
> - `readxl` package - `read_excel()`
> - `readr` package - `read_csv()`, `read_tsv()`

Where is my data?

Common error

```
my_data <- read_csv("weather.csv")
```

```
## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/R
Workshop/Lessons').
```

With no folder (just file name) R expects file to be in **Working directory**

Where is my data?

Common error

```
my_data <- read_csv("weather.csv")
```

```
## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/R
Workshop/Lessons').
```

With no folder (just file name) R expects file to be in **Working directory**

Working directory is:

- Where your RStudio project is
- Your home directory (My Documents, etc.) [If not using RStudio Projects]
- Where you've set it (using **`setwd()`** or RStudio's Session > Set Working Directory)

Where is my data?

Common error

```
my_data <- read_csv("weather.csv")
```

```
## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/R
Workshop/Lessons').
```

With no folder (just file name) R expects file to be in **Working directory**

Working directory is:

- Where your RStudio project is
- Your home directory (My Documents, etc.) [If not using RStudio Projects]
- Where you've set it (using `setwd()` or RStudio's Session > Set Working Directory)

> Using Projects in RStudio is a great idea, try to avoid `setwd()`

Where is my data?

A note on file paths (file locations)

```
/home
```

- folders separated by **/**
- **home** is a folder

Where is my data?

A note on file paths (file locations)

```
/home/steffi/
```

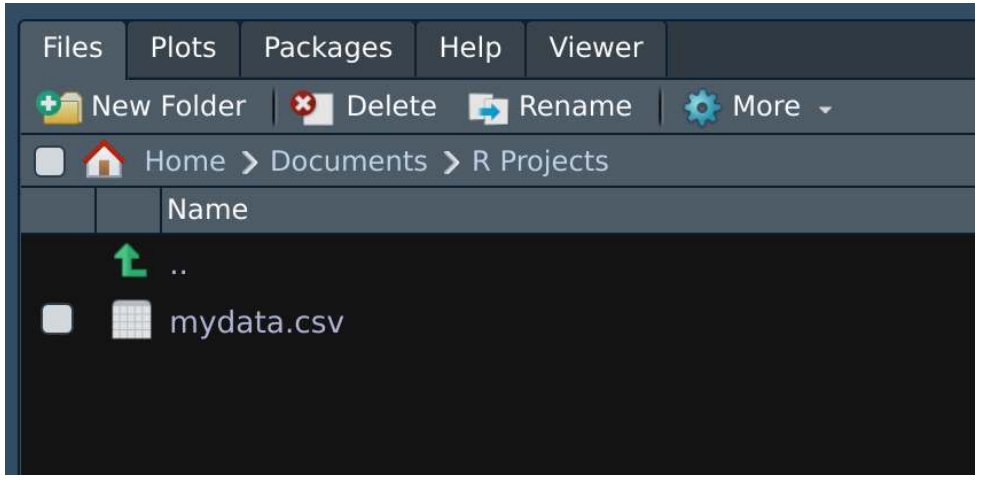
- folders separated by **/**
- **home** and **steffi** are folders
- **steffi** is a folder inside of **home**

Where is my data?

A note on file paths (file locations)

```
/home/steffi/Documents/R Projects/mydata.csv
```

- folders separated by **`/`**
- **`home`**, **`steffi`**, **`Documents`**, **`R Projects`** are folders
- **`steffi`** is inside of **`home`**, **`Documents`** is inside of **`steffi`**, etc.
- **`mydata.csv`** is a data file inside **`R Projects`** folder



RStudio Files Pane

Where is my data?

A note on file paths (file locations)

Absolute Paths

OS	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

Full location, folders and filename

Where is my data?

A note on file paths (file locations)

Absolute Paths

OS	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

Full location, folders and filename

Relative Paths

Path	Where to look
mydata.csv	Here (current directory)
../mydata.csv	Go up one directory (../)
data/mydata.csv	Stay here, go into "data" folder (data/)
../data/mydata.csv	Go up one directory (../), then into "data" folder (data/)

Only include some folders, and filename.

Use relative symbols (e.g., `../`)

Where is my data?

A note on file paths (file locations)

With RStudio 'Projects' only need to use **relative** paths

Absolute Paths

OS	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

Full location, folders and filename

Relative Paths

Path	Where to look
mydata.csv	Here (current directory)
../mydata.csv	Go up one directory (../)
data/mydata.csv	Stay here, go into "data" folder (data/)
../data/mydata.csv	Go up one directory (../), then into "data" folder (data/)

Only include some folders, and filename.

Use relative symbols (e.g., `../`)

Keep yourself organized

For simple projects

- Create an 'RStudio Project' for each Project (Chapter, Thesis, etc.)
- Create a specific "Data" folder within each project (one per project)

```
- Prospect Lake Quality                 # Project Folder
    - prospect_analysis.R
    - data                              # Data Folder
        - prospect_data_2017-01-01.csv
        - prospect_data_2017-02-01.csv
```

Keep yourself organized

For simple projects

- Create an 'RStudio Project' for each Project (Chapter, Thesis, etc.)
- Create a specific "Data" folder within each project (one per project)

```
- Prospect Lake Quality                 # Project Folder
    - prospect_analysis.R
    - data                              # Data Folder
        - prospect_data_2017-01-01.csv
        - prospect_data_2017-02-01.csv
```

- Use **relative** paths to refer to this folder

```
d <- read_csv("data/prospect_data_2017-01-01.csv")
```

Let's Load Some Data!

Your turn: Load some data

1. Create a '**data**' folder in your RStudio project
2. Put **rivers_correct.xlsx** file in the "**data**" folder
3. Load the package

```
library(readxl)
```

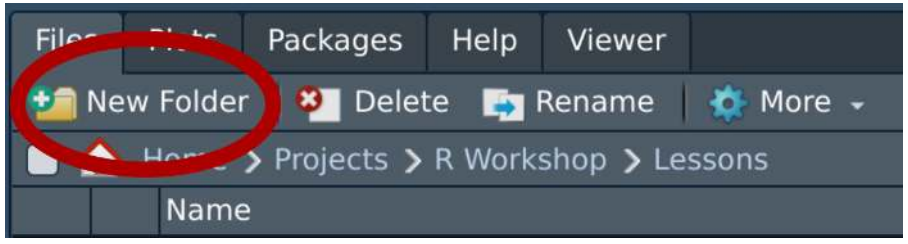
4. Read in the Excel file and assign to object **rivers**

```
rivers <- read_excel("data/rivers_correct.xlsx")
```

5. Use **head()** and **tail()** functions to look at the data

   e.g., **head(rivers)** and **tail(rivers)**

6. Click on the **rivers** object in your "Environment" pane to look at the whole data set



Click on "New Folder"

Use the **'tab'** key in RStudio when typing in the file name for auto-complete

How do I know which function to use?

Look at the file extension:

- `rivers_correct.csv`
- `.csv` = Comma-separated-variables = `read_csv()`

How do I know which function to use?

Look at the file extension:

- `rivers_correct.csv`
- `.csv` = Comma-separated-variables = `read_csv()`

> But not always obvious...

How do I know which function to use?

Look at the file: `master_moch.txt`

- Put this file in your **`data`** folder

- In lower right-hand pane, click on **Files**
  - Click on **data** folder
  - Click on **master_moch.txt**
  - Click "View File" (if asked)

```
ID    region    hab    freq    freq.sd    p.notes
MCB02    kam    0.5266879074    3.9806600009    3.9806600009    0.4592592593
MCB03    kam    -0.9707703735    4.1090031783    4.1090031783    0.5
MCB04    kam    -0.9707703735    4.2463067674    4.2463067674    0.5151515152
```

> This **does not** read the file into R, but only shows you the contents as text.

How do I know which function to use?

Look at the file: `master_moch.txt`

- Put this file in your **`data`** folder
- In lower right-hand pane, click on **Files**
  - Click on **data** folder
  - Click on **master_moch.txt**
  - Click "View File" (if asked)

Hmm, not comma-separated, maybe tab-separated?

```
ID    region    hab    freq    freq.sd    p.notes
MCB02    kam    0.5266879074    3.9806600009    3.9806600009    0.4592592593
MCB03    kam    -0.9707703735    4.1090031783    4.1090031783    0.5
MCB04    kam    -0.9707703735    4.2463067674    4.2463067674    0.5151515152
```

This **does not** read the file into R, but only shows you the contents as text.

How do I know what to use?

Peak:

- Pick a read function with your best guess (**`read_csv()`** is a good start)
- Use **`n_max`** to read only first few rows

```
read_csv("data/master_moch.txt", n_max = 3)
```

```
## # A tibble: 3 × 1
##   `ID\tregion\thab\tfreq\tfreq.sd\tp.notes`
##   <chr>
## 1 "MCB02\tkam\t0.5266879074\t3.9806600009\t3.9806600009\t0.4592592593"
## 2 "MCB03\tkam\t-0.9707703735\t4.1090031783\t4.1090031783\t0.5"
## 3 "MCB04\tkam\t-0.9707703735\t4.2463067674\t4.2463067674\t0.5151515152"
```

> **`\t`** means tab, so this is tab-separated data

How do I know what to use?

Peak:

- Try again with **`read_tsv()`**

```
read_tsv("data/master_moch.txt", n_max = 3)  # note change in function!
```

```
## # A tibble: 3 × 6
##   ID    region    hab  freq freq.sd p.notes
##   <chr> <chr>   <dbl> <dbl>   <dbl>   <dbl>
## 1 MCB02 kam     0.527  3.98    3.98   0.459
## 2 MCB03 kam    -0.971  4.11    4.11   0.5
## 3 MCB04 kam    -0.971  4.25    4.25   0.515
```

> Excellent!

Specifics of loading functions

1. col_names

- Geolocator data

```
my_data <- read_csv("data/geolocators.csv")
my_data
```

```
## # A tibble: 20 × 2
##    `02/05/11 22:29:59`  `64`
##    <chr>               <dbl>
##  1 02/05/11 22:31:59      64
##  2 02/05/11 22:33:59      38
##  3 02/05/11 22:35:59      38
##  4 02/05/11 22:37:59      34
##  5 02/05/11 22:39:59      30
##  6 02/05/11 22:41:59      34
##  7 02/05/11 22:43:59      40
##  8 02/05/11 22:45:59      46
##  9 02/05/11 22:47:59      48
## 10 02/05/11 22:49:59      46
## # … with 10 more rows
```

> Oops?

1. col_names

- Geolocator data

```
my_data <- read_csv("data/geolocators.csv")
my_data
```

```
## # A tibble: 20 × 2
##    `02/05/11 22:29:59`  `64`
##    <chr>               <dbl>
##  1 02/05/11 22:31:59      64
##  2 02/05/11 22:33:59      38
##  3 02/05/11 22:35:59      38

##  9 02/05/11 22:47:59      48
## 10 02/05/11 22:49:59      46
## # … with 10 more rows
```

> Oops?

- **`read_csv`**, **`read_tsv`**, etc. assume that the first row contains the column names
- This file doesn't have headers

1. col_names

Declare no headings

```
my_data <- read_csv("data/geolocators.csv",
                    col_names = FALSE)
my_data
```

```
## # A tibble: 21 × 2
##    X1                  X2
##    <chr>            <dbl>
##  1 02/05/11 22:29:59    64
##  2 02/05/11 22:31:59    64
##  3 02/05/11 22:33:59    38
##  4 02/05/11 22:35:59    38
##  5 02/05/11 22:37:59    34
##  6 02/05/11 22:39:59    30
##  7 02/05/11 22:41:59    34
##  8 02/05/11 22:43:59    40
##  9 02/05/11 22:45:59    46
## 10 02/05/11 22:47:59    48
## # … with 11 more rows
```

1. col_names

Declare no headings

```
my_data <- read_csv("data/geolocators.csv",
                    col_names = FALSE)
my_data
```

```
## # A tibble: 21 × 2
##    X1                  X2
##    <chr>            <dbl>
##  1 02/05/11 22:29:59    64
##  2 02/05/11 22:31:59    64
##  3 02/05/11 22:33:59    38
##  4 02/05/11 22:35:59    38
##  5 02/05/11 22:37:59    34
##  6 02/05/11 22:39:59    30
##  7 02/05/11 22:41:59    34
##  8 02/05/11 22:43:59    40

```

2. `skip` info rows before data

- Grain size data

```
my_data <- read_tsv("data/grain_size.txt")
```

Look at the file:

- Click on **Files** tab
- Click on **data** folder
- Click on **grain_size.txt**
- Click **"View file"** (if asked)

2. `skip` info rows before data

- Grain size data

```
my_data <- read_tsv("data/grain_size.txt")
```

Look at the file:

- Click on **Files** tab
- Click on **data** folder
- Click on **grain_size.txt**
- Click **"View file"** (if asked)

```

Your turn: Load this data set

Try loading the telemetry data set: **Sta_A_Data_2006-11-07.dmp**

1. Look at the file
2. Decide which R function to use based on delimiter (comma, space, or tab?)
3. Any other options need to be specified?

Extra Challenge
Load some of your own tricky data

It should look like this:

```
## # A tibble: 19 × 7
##   StartDate Time     Frequency `Rate/Temp`   Pwr Ant      SD
##       <dbl> <time>       <dbl>       <dbl> <dbl> <chr> <dbl>
## 1     39022 17:15:36      150.        34.8   175 M0        0
## 2     39022 17:19:14      148.        19.2    72 M0        0
## 3     39022 17:19:25      148.        19.7   194 M1        0
## 4     39022 17:20:04      149.        33.8   104 M0        0
## 5     39022 17:20:17      149.        33.7   152 M1        0
## 6     39022 17:20:57      150.        34.2   188 M0        0
## 7     39022 17:22:50      148.         9.8   188 M0        0
## # … with 12 more rows
```

2. Looking for problems

Look at the data

- Make sure columns as expected (correctly assigned file format)
- Make sure no extra lines above the data (should we have used a skip?)
- Make sure column names look appropriate

```
library(palmerpenguins)
penguins
```

```
## # A tibble: 344 × 8
##    species island    bill_length_mm bill_depth_mm flipper_length_mm body_mass_g sex     year

```

- Column names are not great (**`River Name`** not R-friendly) or obvious (what is **`Ele`**?)
- **`Amo`** - should be numeric but isn't
- At least one typo in River (**`Grase`** should be **`Grasse`**)

Example of problematic data

```
skim(rivers)
```

```
##
## ── Variable type: character
──────────────────────────────────────────────────────────────────────────────────────────────────────────────
##   skim_variable n_missing complete_rate   min   max empty n_unique whitespace

Typos in both categorical columns

3. Fixing problems

Cleaning column names

`clean_names()`

```
library(janitor)
rivers <- clean_names(rivers)
rivers
```

```
## # A tibble: 300 × 5
##    river_name  site        ele   amo                wea
##    <chr>       <chr>       <chr> <chr>              <chr>
##  1 Grasse      Up stream   Al    0.605555555555556  sunny
##  2 Grasse      Mid stream  Al    0.425              cloudy
##  3 Grase       Down stream Al    0.194444444444444  sunny
##  4 Oswegatchie Up stream   Al    1                  cloudy
##  5 Oswegatchie Mid stream  Al    0.161111111111111  snowy
##  6 Oswegatchie Down stream Al    0.0333333333333333 cloudy
##  7 Raquette    Up stream   Al    0.291666666666667  cloudy
##  8 Raquette    Mid stream  Al    0.0388888888888889 sunny
##  9 Raquette    Down stream Al    0                  snowy
## 10 St. Regis   Up stream   Al    0.680555555555556  wet
## # … with 290 more rows
```

Cleaning column names

`rename()` columns

```
rivers <- rename(rivers, element = ele, amount = amo)
rivers
```

```
## # A tibble: 300 × 5
##    river_name  site        element amount             wea
##    <chr>       <chr>       <chr>   <chr>              <chr>
##  1 Grasse      Up stream   Al      0.605555555555556  sunny
##  2 Grasse      Mid stream  Al      0.425              cloudy
##  3 Grase       Down stream Al      0.194444444444444  sunny
##  4 Oswegatchie Up stream   Al      1                  cloudy
##  5 Oswegatchie Mid stream  Al      0.161111111111111  snowy
##  6 Oswegatchie Down stream Al      0.0333333333333333 cloudy
##  7 Raquette    Up stream   Al      0.291666666666667  cloudy
##  8 Raquette    Mid stream  Al      0.0388888888888889 sunny
##  9 Raquette    Down stream Al      0                  snowy
## 10 St. Regis   Up stream   Al      0.680555555555556  wet

##  6 Oswegatchie Down stream Al      0.0333333333333333
##  7 Raquette    Up stream   Al      0.291666666666667
##  8 Raquette    Mid stream  Al      0.0388888888888889
##  9 Raquette    Down stream Al      0
```

Cleaning columns

Put it all together

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers
```

```
## # A tibble: 300 × 4
##    river_name  site        element amount
##    <chr>       <chr>       <chr>   <chr>
##  1 Grasse      Up stream   Al      0.605555555555556
##  2 Grasse      Mid stream  Al      0.425
##  3 Grase       Down stream Al      0.194444444444444
##  4 Oswegatchie Up stream   Al      1
##  5 Oswegatchie Mid stream  Al      0.161111111111111
##  6 Oswegatchie Down stream Al      0.0333333333333333
##  7 Raquette    Up stream   Al      0.291666666666667
##  8 Raquette    Mid stream  Al      0.0388888888888889
##  9 Raquette    Down stream Al      0
## 10 St. Regis   Up stream   Al      0.680555555555556
```

Cleaning columns

Put it all together

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers
```

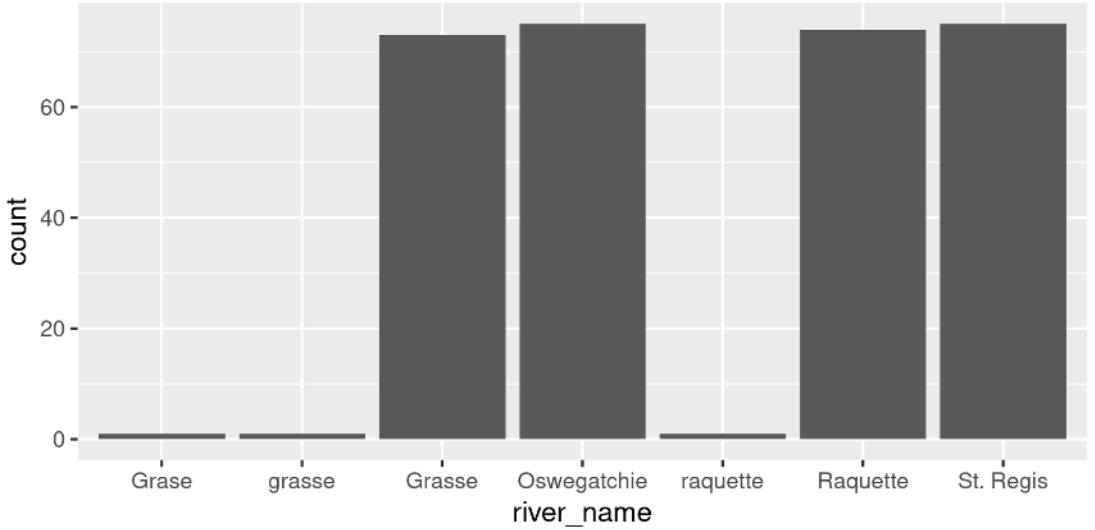
Note repeated data frame **rivers**

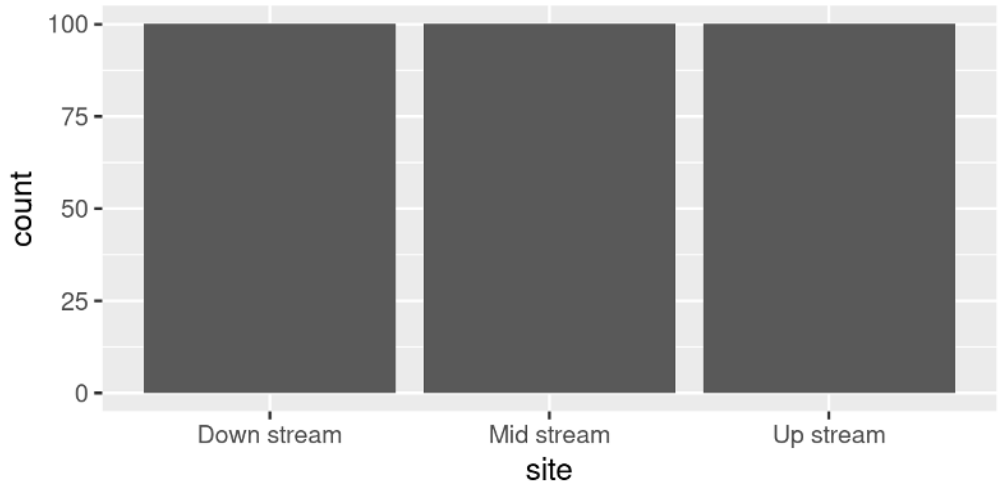
```
## # A tibble: 300 × 4
##    river_name  site        element amount
##    <chr>       <chr>       <chr>   <chr>
##  1 Grasse      Up stream   Al      0.605555555555556
##  2 Grasse      Mid stream  Al      0.425
##  3 Grase       Down stream Al      0.194444444444444
##  4 Oswegatchie Up stream   Al      1
##  5 Oswegatchie Mid stream  Al      0.161111111111111
##  6 Oswegatchie Down stream Al      0.0333333333333333
##  7 Raquette    Up stream   Al      0.291666666666667
##  8 Raquette    Mid stream  Al      0.0388888888888889
##  9 Raquette    Down stream Al      0
## 10 St. Regis   Up stream   Al      0.680555555555556
```

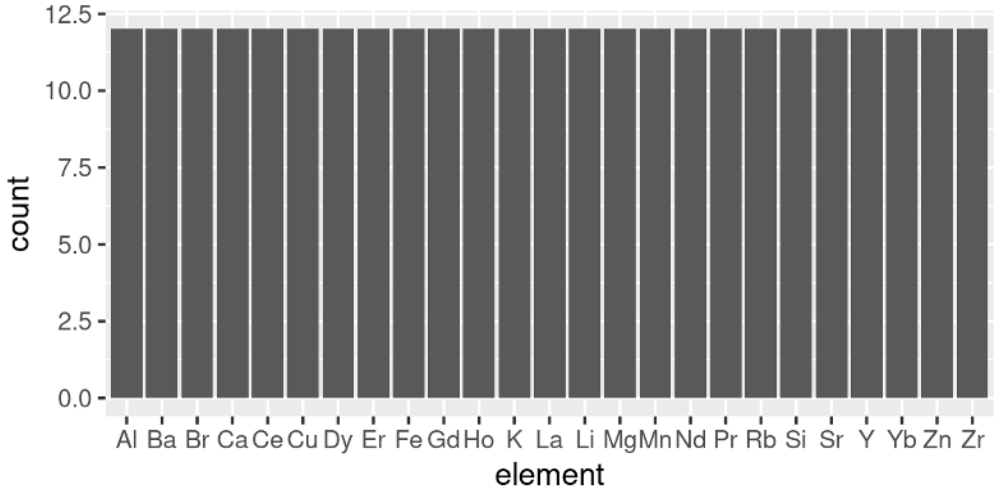
Fixing typos

Look for typos (Visually)

```
ggplot(data = rivers, aes(x = river_name)) + geom_bar()
ggplot(data = rivers, aes(x = site)) + geom_bar()
ggplot(data = rivers, aes(x = element)) + geom_bar()
```







Fixing typos

Look for typos with `count()`

```
count(rivers, river_name)
```

```
## # A tibble: 7 × 2
##   river_name      n
##   <chr>       <int>
## 1 Grase           1
## 2 grasse          1
## 3 Grasse         73
## 4 Oswegatchie    75
## 5 raquette        1
## 6 Raquette       74
## 7 St. Regis      75
```

`filter()` the data to highlight them

```
filter(rivers, river_name == "Grase")
```

```
## # A tibble: 1 × 4
##   river_name site        element amount
##   <chr>      <chr>       <chr>   <chr>
## 1 Grase      Down stream Al      0.194444444444444
```

Fixing typos

Replace typos

Combine the **`if_else()`** / **`case_when()`** functions with **`mutate()`** function

`mutate()` creates or changes columns in a data frame:

```
mutate(dataframe, column = new_values)
```

`if_else()` tests for a condition, and returns one value if FALSE and another if TRUE

```
if_else(condition, value_if_true, value_if_false)
```

`case_when()` tests for multiple conditions, and returns different values depending

```
case_when(condition1 ~ value_if_true1,
          condition2 ~ value_if_true2,
          condition3 ~ value_if_true3,
          TRUE ~ default_value)
```

Fixing typos

Replace typos

Combine the **`if_else`** function with the **`mutate()`** function

```
rivers <- mutate(rivers, river_name = if_else(river_name == "Grase", "Grasse", river_name))
```

Check that it's gone:

```
filter(rivers, river_name == "Grase")
```

```
## # A tibble: 0 × 4
## # … with 4 variables: river_name <chr>, site <chr>, element <chr>, amount <chr>
```

Iterative process

- Make some corrections
- Check the data
- Make some more corrections (either add to or modify existing code)

Your Turn: Fix another one of the "Grasse" typos

1. Check the data with **`count()`**
2. Use **`mutate()`** and **`if_else()`** to fix the typo

Extra Challenge
Examine and fix problems in your own data

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers, river_name = if_else(river_name == "Grase", "Grasse", river_name))

rivers <- mutate(???, ??? = ???)
```

Fixing typos

To be more efficient, fix all typos at once

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers,
                 river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

== compares one item to one other

%in% compares one item to many different ones

Tangent: `tidyverse` functions

`rename()`, `select()`, `mutate()`

- **`tidyverse`** functions always start with the **data**, followed by other arguments
- you can reference any **column** from '**data**'

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers,
                 if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

- **`rename()`** changes column names
- **`select()`** chooses columns to keep or to remove (with **`-`**)
- **`mutate()`** changes column contents

Tangent: Why use `tidyverse` functions?

Pipes! `%>%` Allow you to string commands together

Instead of:

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers,
                 if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

Tangent: Why use `tidyverse` functions?

Pipes! `%>%` Allow you to string commands together

Instead of:

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers,
                 if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

We have:

```
rivers <- read_csv("data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

Play around

Take a moment to play with this code in your console

Convert this:

```
rivers <- read_csv("data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers,
                 river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

To this:

```
rivers <- read_csv("data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

Your turn: Fix the remaining typo

- Remember this is an iterative process (you may find your self reloading the data often)
- Find the typo (expect `river_name`: **Grasse**, **Oswegatchie**, **Raquette**, **St.Regis**)
- Add fix to code:

Extra Challenge
Examine and fix problems in your own data

```
rivers <- read_csv("data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

Remember...

Comparing single items

```
A == "hello"
A %in% "hello"
```

Comparing multiple items

```
A %in% c("hello", "bye"))
# NOT A == c("hello", "bye")
```

Your turn: Fix the remaining typo

- Remember this is an iterative process (you may find your self reloading the data often)
- Find the typo (expect `river_name`: **Grasse**, **Oswegatchie**, **Raquette**, **St.Regis**)
- Add fix to code:

Extra Challenge
Examine and fix problems in your own data

```
rivers <- read_csv("data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "grasse"), "Grasse", river_name))
```

Remember...

Comparing single items

```
A == "hello"
A %in% "hello"
```

Comparing multiple items

```
A %in% c("hello", "bye"))
# NOT A == c("hello", "bye")
```

4. Fixing formats

Typos that affect classes (formats)

Look for problems

```
rivers
```

```
## # A tibble: 300 × 4
##    river_name  site        element amount
##    <chr>       <chr>       <chr>   <chr>
##  1 Grasse      Up stream   Al      0.605555555555556
##  2 Grasse      Mid stream  Al      0.425
##  3 Grasse      Down stream Al      0.194444444444444
##  4 Oswegatchie Up stream   Al      1
##  5 Oswegatchie Mid stream  Al      0.161111111111111
##  6 Oswegatchie Down stream Al      0.0333333333333333
##  7 Raquette    Up stream   Al      0.291666666666667
##  8 Raquette    Mid stream  Al      0.0388888888888889
##  9 Raquette    Down stream Al      0
## 10 St. Regis   Up stream   Al      0.680555555555556
## # … with 290 more rows
```

Why all character (chr)?

Changing classes

Function	Input	Output
`as.character()`	Any vector	Text (Characters)
`as.numeric()`	Any vector (but returns NAs if not numbers)	Numbers
`as.logical()`	TRUE, FALSE, T, F, 0 (FALSE), any other number (all TRUE)	TRUE or FALSE
`as.factor()`	Any vector	Categories

Changing classes

Function	Input	Output
`as.character()`	Any vector	Text (Characters)
`as.numeric()`	Any vector (but returns NAs if not numbers)	Numbers
`as.logical()`	TRUE, FALSE, T, F, 0 (FALSE), any other number (all TRUE)	TRUE or FALSE
`as.factor()`	Any vector	Categories

For example...

```
a <- c(1, 2, 10)

as.character(a)
```

```
## [1] "1"  "2"  "10"
```

```
as.numeric(a)
```

```
## [1]  1  2 10
```

```
b <- c("hello", "bye", 1)
as.character(b)
```

```
## [1] "hello" "bye"   "1"
```

```
as.numeric(b)
```

```
## Warning: NAs introduced by coercion
```

```
## [1] NA NA  1
```

> We'll deal with dates and times later...

Fixing numerical typos

Find the problem (when we don't know what they are)

- Make a new column and convert **`amount`** to numbers

```
rivers <- mutate(rivers, amount2 = as.numeric(amount))
```

```
## Warning in mask$eval_all_mutate(quo): NAs introduced by coercion
```

> **`NAs introduced by coercion`** means the function was forced to create **`NA`**s.
> This warning tells us that some values didn't convert to numbers

Fixing numerical typos

Find the problem (when we don't know what it is)

- Make a new column and convert **`amount`** to numbers
- Find out where the conversion didn't work

```
filter(rivers, !is.na(amount), is.na(amount2))
```

```
## # A tibble: 1 × 5
##   river_name site       element amount amount2
##   <chr>      <chr>      <chr>   <chr>    <dbl>
## 1 Raquette   Mid stream Ca      <0.1        NA
```

- **`is.na()`** is **`TRUE`** when the value is missing (**`NA`**)
- **`!`** turns a **`TRUE`** into a **`FALSE`** (and vice versa)
- This asks, which values are not missing to begin with (**`!is.na(amount)`**) but *are* missing after the conversion (**`is.na(amount2)`**)

Fixing numerical typos

Find the problem (when we know what it is):

```
filter(rivers, amount == "<0.1")
```

```
## # A tibble: 1 × 5
##   river_name site       element amount amount2
##   <chr>      <chr>      <chr>   <chr>    <dbl>
## 1 Raquette   Mid stream Ca      <0.1        NA
```

Fixing numerical typos

Find the problem (when we know what it is):

```
filter(rivers, amount == "<0.1")
```

```
## # A tibble: 1 × 5
##   river_name site       element amount amount2
##   <chr>      <chr>      <chr>   <chr>    <dbl>
## 1 Raquette   Mid stream Ca      <0.1        NA
```

Fix problem

```
rivers <- mutate(rivers, amount = if_else(amount == "<0.1", "0", amount))
```

Fixing numerical typos

Find the problem (when we know what it is):

```
filter(rivers, amount == "<0.1")
```

```
## # A tibble: 1 × 5
##   river_name site       element amount amount2
##   <chr>      <chr>      <chr>   <chr>    <dbl>
## 1 Raquette   Mid stream Ca      <0.1        NA
```

Fix problem

```
rivers <- mutate(rivers, amount = if_else(amount == "<0.1", "0", amount))
```

Correct the class

```
rivers <- mutate(rivers, amount = as.numeric(amount))
```

Fixing numerical typos

Last, but not least, check...

```
rivers
```

```
## # A tibble: 300 × 5
##    river_name  site        element amount amount2
##    <chr>       <chr>       <chr>    <dbl>   <dbl>
##  1 Grasse      Up stream   Al       0.606   0.606
##  2 Grasse      Mid stream  Al       0.425   0.425
##  3 Grasse      Down stream Al       0.194   0.194
##  4 Oswegatchie Up stream   Al       1       1
##  5 Oswegatchie Mid stream  Al       0.161   0.161
##  6 Oswegatchie Down stream Al       0.0333  0.0333
##  7 Raquette    Up stream   Al       0.292   0.292
##  8 Raquette    Mid stream  Al       0.0389  0.0389
##  9 Raquette    Down stream Al       0       0
## 10 St. Regis   Up stream   Al       0.681   0.681
## # … with 290 more rows
```

Put it together...

```
rivers <- read_csv("data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = case_when(river_name %in% c("Grase", "grasse") ~ "Grasse",
                                river_name == "raquette" ~ "Raquette",
                                TRUE ~ river_name),
         amount = if_else(amount == "<0.1", "0", amount),
         amount = as.numeric(amount))
```

And you have a clean, corrected data frame ready to use

- You have not changed the original data
- You have a **reproducible** record of all corrections
- You can alter these corrections at any time
- You have formatted your data for use in R

Dates and Times

(Or why does R hate me?)

Dates and Times

- Date/times aren't always recognized as date/times

```
geolocators <- read_csv("data/geolocators.csv", col_names = c("time", "light"))
geolocators
```

```
## # A tibble: 21 × 2
##   time                light
##   <chr>               <dbl>
## 1 02/05/11 22:29:59    64
## 2 02/05/11 22:31:59    64
## 3 02/05/11 22:33:59    38
## 4 02/05/11 22:35:59    38
## 5 02/05/11 22:37:59    34
## 6 02/05/11 22:39:59    30
## # … with 15 more rows
```

> Here **`time`** column is considered **`chr`** (character/text)

Artwork by @allison_horst

`lubridate` package

- Part of **`tidyverse`**, but needs to be loaded separately
- Great for converting date/time formats

```
library(lubridate)
geolocators <- mutate(geolocators, time_formatted = dmy_hms(time))
geolocators
```

```
## # A tibble: 21 × 3
##   time              light time_formatted
##   <chr>             <dbl> <dttm>
## 1 02/05/11 22:29:59    64 2011-05-02 22:29:59
## 2 02/05/11 22:31:59    64 2011-05-02 22:31:59
## 3 02/05/11 22:33:59    38 2011-05-02 22:33:59
## 4 02/05/11 22:35:59    38 2011-05-02 22:35:59
## 5 02/05/11 22:37:59    34 2011-05-02 22:37:59
## 6 02/05/11 22:39:59    30 2011-05-02 22:39:59
## # … with 15 more rows
```

`lubridate` package

Generally, only the order of the **y**ear, **m**onth, **d**ay, **h**our, **m**inute, or **s**econd matters.

date/time	function	class
2018-01-01 13:09:11	`ymd_hms()`	dttm (POSIXct/POSIXt)
12/20/2019 10:00 PM	`mdy_hm()`	dttm (POSIXct/POSIXt)
31/01/2000 10 AM	`dmy_h()`	dttm (POSIXct/POSIXt)
31-01/2000	`dmy()`	Date

> `lubridate` is smart enough to detect AMs and PMs

Note: R *generally* requires that times have dates (`datetime`/`POSIXct`), but dates don't have to have times (`Date`)

5. Saving data

Saving data

Keep yourself organized

- Keep your R-created data in a **different** folder from your 'raw' data *
- If you have a lot going on, split your work into several scripts, and number the both the scripts AND the data sets produced:
  - `1_cleaned.csv`
  - `2_summarized.csv`
  - `3_graphing.csv`

Saving data

Keep yourself organized

- Keep your R-created data in a **different** folder from your 'raw' data *
- If you have a lot going on, split your work into several scripts, and number the both the scripts AND the data sets produced:
  - `1_cleaned.csv`
  - `2_summarized.csv`
  - `3_graphing.csv`

Save your data to file:

```
write_csv(rivers, "datasets/rivers_cleaned.csv")
```

* I usually have a `data` folder and then both `raw` and `datasets` folders inside of that

Dealing with data

1. Loading data

- Get your data into R

2. Looking for problems

- Typos
- Incorrectly loaded data

3. Fixing problems

- Corrections
- Renaming

4. Setting formats

- Dates
- Numbers
- Factors

5. Saving your data

Wrapping up: Common mistakes

Assuming your data is in one format when it's not

- Print your data to the console and use `skim()` to explore the format of your data
- Use `skim()`, `count()`, `filter()`, `select()`, `ggplot()` to explore the content of your data

Wrapping up: Common mistakes

Confusing pipes with function arguments

- Pipes (**%>%**) pass the *output* from one function as *input* to the next function:

```
my_data <- my_data %>%                  # Pass my_data
  filter(my_column > 5) %>%             # Pass my_data, filtered
  select(my_column, my_second_column)
```

- Arguments may be on different lines, but all part of *one* function

```
my_data <- my_data %>%                  # Pass my_data
  mutate(my_column1 = replace(...),     # No passing (no pipes!)
         my_column2 = replace(...),     # Instead, give 3 arguments to mutate:
         my_column3 = replace(...))     # Arguments separated by ",", and surrounded by ( )
```

Wrapping up: Further reading

- R for Data Science
  - Chapter 5: Transforming data
  - Chapter 8: RStudio Projects
  - Chapter 14: Strings
  - Chapter 15: Factors
  - Chapter 18: Pipes
