Analysis and Data Tools for Science

Compiled: 2024-02-21

These are me and my creatures

This is my garden 🖨

Introductions

Dr. Steffi LaZerte

- Background in Biology (Animal Behaviour)
- Working with R since 2007
- Professional R programmer/consultant since 2017
- rOpenSci Community Assistant

Introductions

Dr. Alex Koiter (Today's Teaching Assistant)

- Physical Geographer
- Working with R since 2010
- Associate Professor in Geography and Environment, Brandon University

What about you?

- Name
- Background (Role, Area of study, etc.)
- Familiarity with R or Programming
- Creatures (furry, feathery, scaley, green or otherwise)?

About this Workshop

Format

- I will provide you tools and workflow to get started with R
- We'll have hands-on activities, lectures, and demonstrations
- Video on or off, however works best for you!

Questions

- Ask questions by un-muting, or ask in the chat (Alex will monitor)
 - Workshop-related questions we'll address together
 - Specific, system-related problems, Alex will help you in the "Troubleshooting Room"

Getting help

- Share your screen
- Share your code
 - In chat
 - Or in a community notebook: https://collabedit.com/kxyap

R is hard: But have no fear!

- Don't expect to remember everything!
- Copy/Paste is your friend (never apologize for using it!)
- Consider this workshop a resource to return to

What is R?

RStudio vs. R

R

• **RStudio** is not **R**

- RStudio is a User Interface or IDE (integrated development environment)
 - (i.e., Makes coding simpler)

Open RStudio

R is a Programming language

A programming language is a way to give instructions in order to get a computer to do something

- You need to know the language (i.e., the code)
- Computers don't know what you mean, only what you type (unfortunately)
- Spelling, punctuation, and capitalization all matter!

For example

R, what is 56 times 5.8?

56 * 5.8

[1] 324.8

Use code to tell R what to do

R, what is the average of numbers 1, 2, 3, 4?

```
mean(c(1, 2, 3, 4))
```

[1] 2.5

R, save this value for later

steffis_mean <- mean(c(1, 2, 3, 4))</pre>

R, multiply this value by 6

steffis_mean * 6

[1] 15

Why R?

R is hard

```
# Get in circle around city
 circle <- data.frame()
 cutoff <- 10
 for(i in unique(gps$region)) {
    n <- nrow(gps[gps$region == i,]) ##number of IDs</pre>
   if(i == "wil") tmp <- geocode("Williams Lake, Canada")</pre>
   if(i == "kam") tmp <- geocode("Kamloops, Canada")</pre>
   if(i == "kel") tmp <- geocode("Kelowna, Canada")
    temp <- data.frame()</pre>
   for(a in 1:n){
     if(a <= cutoff) temp <- rbind(temp, gcDestination(lon = tmp$lon,
                                                          lat = tmp$lat,
                                                          bearing = (a*(360/(cutoff))-360/(cutoff)),
                                                          dist = 20,
                                                          dist.units = "km",
                                                          model = "WGS84"))
      if(a > cutoff) temp <- rbind(temp, gcDestination(lon = tmp$lon,
                                                         lat = tmpSlat.
                                                         bearing = ((a-cutoff)*(360/(max(table(gpsSregion))))
))-10))-360/(max(table(gps$region))-cutoff)),
                                                         dist = 35,
                                                         dist.units = "km",
                                                         model = "WGS84"))
    circle <- rbind(circle, cbind(temp,
                                   region = i,
                                   hab = gps$hab[gps$region == i],
                                   spl = gps$spl.orig[gps$region == i],
```

But R is powerful (and reproducible)!

💼 Global Environn	nent 🗸	
Data		
🔘 fish	172 obs. of 13 variables	
<pre>O telem_total</pre>	12950046 obs. of 10 variables	
Values		
tz	"Etc/GMT+8"	
Functions		
load_data	function (x)	

R is also beautiful

R is affordable (i.e., free!)

R is available as Free Software under the terms of the Free Software Foundation's GNU General Public License in source code form. It compiles and runs on a wide variety of UNIX platforms and similar systems (including FreeBSD and Linux), Windows and MacOS.

Impost R Syndrome

Moral of the story?

Make friends, code in groups, learn together and don't beat yourself up

The Goal

About R

Code, Output, Scripts

Code

• The actual commands

Output

• The result of running code or a script

Script

- A text file full of code that you want to run
- You should always keep your code in a script

For example:

Code))	3,	2,	<pre>mean(c(1,</pre>		
Output					2.5	[1]
Script						

0 4_an	alysis.R 😒				
	🛫 🔒 🗋 Source on Save 🔍 🎢 📲	🗕 🕂 Run	2 +	🤜 Source 👻	
15	#' # Setup				-
16	## @knitr setup				
17	library(tidyverse)				
18	library(stringr)				
19	library(gridExtra)				
20	library(grid)				
21	library(boot)				
22					
23	<pre>theme_cust <- theme_bw() +</pre>				
24	<pre>theme(panel.grid = element_blank())</pre>				
25					
26	#' Load data				
27	<pre>d <- read_csv("/Data/Datasets/pca.csv") %>%</pre>				
28	<pre>mutate(hab_c = ifelse(hab > 0, "Urban", "Rural"))</pre>				
29					
30	<pre>summary(d\$hab)</pre>				
31					
32	#' # Plotting				
33	d_sum <- d %>%				
34	group_by(hab_c) %>%				
35	<pre>summarize(prop = sum(atypical_c) / length(atypical_c))</pre>				
36					
37	<pre>d_n <- count(d, atypical_c, hab_c)</pre>				
38					
39	#' # Sample sizes

42	<pre>count(d, atypical_c)</pre>				
43	<pre>count(d, lowhigh, monotone, freq_sweep)</pre>				
44					
45	count(d, region)				

RStudio Features

Projects

- Handles working directories
- Organizes your work

Changing Options: Tools > Global Options

- General > Restore RData into workspace at startup (NO!)
- General > Save workspace to on exit (NEVER!)
- Code > Insert matching parens/quotes (Personal preference)

Packages

- Can use the package manager to install packages
- Can use the manager to load them as well, but not recommended

Let's change some options in RStudio!

Getting Ready

Dpen New File

(make sure you're in the RStudio Project)

Write library(tidyverse) at the top

Save this new script

(consider names like intro.R or 1_getting_started.R)

Your first *real* code!

```
1 # First load the packages
2 library(palmerpenguins)
3 library(ggplot2)
4
5 # Now create the figure
6 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
7 geom_point()
```

1. Copy/paste or type this into the script window in RStudio

- You may have to go to File > New File > R Script
- 2. Click on the **first line of code**
- 3. Run the code
 - Click 'Run' button (upper right) or
 - Use the short-cut Ctrl-Enter
- 4. Repeat until all the code has run

```
1 # First load the packages
2 library(palmerpenguins)
3 library(ggplot2)
4
5 # Now create the figure
6 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
7 geom_point()
```

```
1 # First load the packages
2 library(palmerpenguins)
3 library(ggplot2)
4
5 # Now create the figure
6 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
7 geom_point()
```

```
1 # First load the packages
2 library(palmerpenguins)
3 library(ggplot2)
4
5 # Now create the figure
6 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
7 geom_point()
```

```
1 # First load the packages
2 library(palmerpenguins)
3 library(ggplot2)
4
5 # Now create the figure
6 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
7 geom_point()
```

R Basics: Objects

Objects are *things* in the environment

(Check out the **Environment** pane in RStudio)

functions()

Do things, Return things

Does something but returns nothing

e.g., library() - Loads an R package so we can use it's functions and other objects it supplies

```
1 library(palmerpenguins)
```

Does something and returns something

```
e.g., ggplot() - Creates and returns a basic plot
```

functions()

- Functions can take **arguments** (think 'options')
- data, x, y, colour

```
1 ggplot(data = penguins, aes(x = body_mass_g, y = bill_length_mm, colour = species)) +
```

- 2 geom_point()
- Arguments defined by **name** or by **position**
- With correct position, do not need to specify by name **By name:**

1 mean(x = c(1, 5, 10))

[1] 5.333333

By order:

```
1 mean(c(1, 5, 10))
```

[1] 5.333333

functions()

Watch out for 'hidden' arguments

By name:

	1 2	<pre>mean(x = c(1, 5, 10,</pre>	NA),
[1]	5.333333		

By order:

1 mean(c(1, 5, 10, NA), 2 TRUE)
Error in mean.default(c(1, 5, 10, NA), TRUE): 'trim' must be
numeric of length one

This error states that we've assigned the argument trim to a non-valid argument Where did trim come from?

R documentation

1 ?mean

mean {base}

R Documentation

Arithmetic Mean

Description

Generic function for the (trimmed) arithmetic mean.

Usage

mean(x, ...)

```
## Default S3 method:
mean(x, trim = 0, na.rm = FALSE, ...)
```

Arguments

- An R object. Currently there are methods for numeric/logical vectors and <u>date</u>, <u>date</u>.
 <u>time</u> and <u>time interval</u> objects. Complex vectors are allowed for trim = 0, only.
- trim the fraction (0 to 0.5) of observations to be trimmed from each end of x before the mean is computed. Values of trim outside that range are taken as the nearest endpoint.
- na.rm a logical value indicating whether NA values should be stripped before the computation proceeds.
- ... further arguments passed to or from other methods.

Data

- Generally kept in vectors or data.frames (also tibbles)
- These are objects with names (like functions)
- Here are two **built-in** examples (part of R)

Vector (1 dimension)

Data frame (2 dimensions)

1 month.name

[1]	"January"	"February"	"March"
[4]	"April"	"May"	"June"
[7]	"July"	"August"	"September"
[10]	"October"	"November"	"December"

• Columns have different types of variables

Your Turn: Vectors and Data frames

Try out the following code...

- Here we will make a vector and a data frame
- What is the output in your console?
- How does your environment change (upper right panel)?

Vectors

Data frames

1 a <- c("apples", 12, "pears", 5, 8)	1 my_data <- data.frame(x = c("s1", "s2", "s3", "s4"),
2 a	2 $y = c(101, 102, 103, 104),$
	3 $z = c("a", "b", "c", "d"))$
	4 my_data

Your Turn: Vectors and Data frames

Try out the following code...

- What does : do?
- What does **C**() do?
- Why use a comma with data frames?

Vectors

- Use [index] to access part of a vector
- Can access multiple parts at once

1 a[2]
2 a[2:5] # What does : do?
3 a[c(1, 3)] # What does c() do?

Data frames

- x\$colname to pull columns out as vector
- x[row, col] to access rows/columns

```
1 my_data[3, ] # Why the comma?
2 my_data[3, 1]
3 my_data[, 1:2]
```

Your Turn: Vectors and Data frames

Try out the following code...

Vectors

1 a[2]	
[1] "12"	
⊥ a[2:5]	# What does : do?
[1] "12" "pears"	"5" "8"
1 a[c(1,	3)] # What does c() do?
[1] "apples" "pears"	n

Data frames

	1	<pre>my_data[3,]</pre>	#	Why	the	comma?
x y 3 s3 103	Z C					
	1	<pre>my_data[3, 1]</pre>				
[1] "s3"						
	1	<pre>my_data[, 1:2]</pre>				
x y 1 s1 101 2 s2 102 3 s3 103 4 s4 104						

Miscellaneous

R has spelling and punctuation

- R cares about spelling
- R is also case sensitive! (Apple is not the same as apple)

R has spelling and punctuation

• Commas are used to separate arguments in functions

This is correct:

1 mean(c(5, 7, 10)) # [1] 7.333333

This is **not** correct:

1 mean(c(5 7 10))

>80% of learning R is learning to **troubleshoot**!

R has spelling and punctuation

Spaces usually don't matter unless they change meanings

1 5>=6 # [1] FALSE
2 5 >=6 # [1] FALSE
3 5 >= 6 # [1] FALSE
4 5 > = 6 # Error: unexpected '=' in "5 > ="

Periods don't matter either, but can be used in the same way as letters

(But don't)

1 apple.oranges <- "fruit"</pre>

Assignments and Equal signs

Use <- to assign values to objects

1 a <- "hello"

Use = to set function arguments

1 mean(x = c(4, 9, 10))

Use == to determine equivalence (logical)

1 10 == 10 # [1] TRUE 2 10 == 9 # [1] FALSE

Braces/Brackets

Round brackets: ()

• Identify functions (even if there are no arguments)

1 Sys.Date() # Get the Current Date

[1] "2024-02-21"

• Without the (), R spits out information on the function:

1 Sys.Date

function ()
as.Date(as.POSIXlt(Sys.time()))
<bytecode: 0x561fe69e47b8>
<environment: namespace:base>

() must be associated with a **function** (Well, *almost* always)

Square brackets: []

• Extract parts of objects

	1	LETTERS																			
[1] "A" [20] "T"	"B" "U"	"C" "D" "	E" "F" X" "Y"	"G" "Z"	"H"	"I"	"J"	"K"	"L"	"M"	"N"	"0"	"P"	"Q"	"R"	" 5	'S"				
	1	LETTERS [1]																		
[1] "A"																					
	1	LETTERS [2	6]																		
[1] "Z"																					

[] have to be associated with an **object** that has dimensions (Always!)

Improving code readability

Use spaces like you would in sentences:

1 a <- mean(c(4, 10, 13))

is easier to read than

1 a<-mean(c(4,10,13))

(But the same, coding-wise)

Improving code readability

Don't be afraid to use line breaks ('Enters') to make the code more readable

Hard to read

1 a <- data.frame(exp = c("A", "B", "A", "B", "A", "B"), sub = c("A1", "A1", "A2", "A2", "A3", "A3"), res = c(10,

Easier to read

1 a <- data.frame(exp = c("A", "B", "A", "B", "A", "B"), 2 sub = c("A1", "A1", "A2", "A2", "A3", "A3"), 3 res = c(10, 12, 45, 12, 12, 13))

(But the same, coding-wise)

Let's go!
